

Figure: the genre network assembling, 1678–1928

166 novels, one per author. Positions are fixed from the final k -NN layout; only publication is temporal. A novel is grey until the community it belongs to reaches three members — the same threshold the pipeline uses to call a community real — so clusters are seen cohering rather than assumed. Rings mark arrivals since the previous panel. "Cohered" counts final communities whose novels have arrived; it cannot fall. Louvain re-partitioning, which can and does fall, is the ledger's business, not this figure's.

1750

7 novels · 1/8 cohered
+7 since 1678

1800

24 novels · 3/8 cohered
+17 since 1750

1850

51 novels · 5/8 cohered
+27 since 1800

1880

74 novels · 6/8 cohered
+23 since 1850

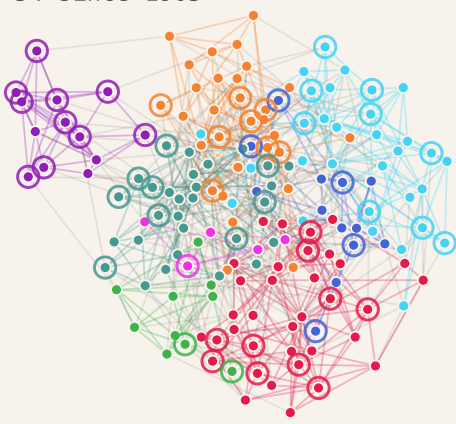

1905

112 novels · 8/8 cohered
+38 since 1880

1928

166 novels · 8/8 cohered
+54 since 1905

In bold: the one community with a datable emergence ($z \approx -3.0$). The rest are perennial modes, spread across all 250 years.
